With reference to the number of moieties (e.g., substituents, groups or rings) in a compound, unless otherwise defined, the phrases "one or more" and "at least one" mean that there can be as many moieties as chemically permitted, and the

20 determination of the maximum number of such moieties is well within the knowledge of those skilled in the art. For example, "one or more" or "at least one" can mean 1 to 6 moieties, and generally 1 to 4 moieties, and usually 1 to 3 moieties.

The term "effective amount" or "therapeutically effective amount" as used in the methods, pharmaceutical compositions, claims and elsewhere of this invention

25 means a therapeutically effective amount to achieve the desired therapeutic effect in a suitable patient.

Those skilled in the art will appreciate that the term "neurodegenerative disease" has its commonly accepted medical meaning and describes diseases and conditions resulting from abnormal function of neurons, including neuronal death and

30 abnormal release of neurotransmitters or neurotoxic substances. In this instance it also includes all diseases resulting from abnormal levels of beta amyloid protein. Examples of such diseases include, but are not limited to, Alzheimer's disease, age-related dementia, cerebral or systemic amyloidosis, hereditary cerebral hemorrhage with amyloidosis, and Down's syndrome.

- 14 -

Lines drawn into the ring systems indicate that the indicated bond may be attached to any of the substitutable ring carbon atoms.

As well known in the art, a bond drawn from a particular atom wherein no moiety is depicted at the terminal end of the bond indicates a methyl group bound through that bond to the atom. For example:

Certain compounds of the invention may exist in different isomeric (e.g., enantiomers and diastereoisomers) forms. The invention contemplates all such isomers both in pure form and in admixture, including racemic mixtures. Enol forms are also included.

15

The compounds of the invention can be administered as racemic mixtures or enantiomerically pure compounds.

Certain compounds will be acidic in nature, e.g. those compounds which possess a carboxyl or phenolic hydroxyl group. These compounds may form

- 15 -

pharmaceutically acceptable salts. Examples of such salts may include sodium, potassium, calcium, aluminum, gold and silver salts. Also contemplated are salts formed with pharmaceutically acceptable amines such as ammonia, alkyl amines, hydroxyalkylamines, N-methylglucamine and the like.

5 Certain basic compounds also form pharmaceutically acceptable salts, e.g., acid addition salts. For example, the pyrido-nitrogen atoms may form salts with strong acid, while compounds having basic substituents such as amino groups also form salts with weaker acids. Examples of suitable acids for salt formation are hydrochloric, sulfuric, phosphoric, acetic, citric, oxalic, malonic, salicylic, malic,
10 fumaric, succinic, ascorbic, maleic, methanesulfonic and other mineral and carboxylic acids well known to those in the art. The salts are prepared by contacting the free base form with a sufficient amount of the desired acid to produce a salt in the conventional manner. The free base forms may be regenerated by treating the salt with a suitable dilute aqueous base solution such as dilute aqueous NaOH,
15 potassium carbonate, ammonia and sodium bicarbonate. The free base forms differ from their respective salt forms somewhat in certain physical properties, such as solubility in polar solvents, but the acid and base salts are otherwise equivalent to their respective free base forms for purposes of the invention.

All such acid and base salts are intended to be pharmaceutically acceptable
20 salts within the scope of the invention and all acid and base salts are considered equivalent to the free forms of the corresponding compounds for purposes of the invention.

Compounds of formula I can be prepared by various methods well known to those skilled in the art, and by the methods described below.

Method 1

In Method 1, compounds of formula I having the structure Ia are prepared.

- 28 -

In method 1, R^{12} represents the Y substituents defined above in paragraphs (3) to (18) of the definition of Y. When the reagents $R^{12}COCl$ or $R^{12}COOH$ are used in Method 1, then Y in formula 1a represents R^{12} .

In Method 1, a trans-substituted N-Boc-cyclic amine 2-carboxaldehyde 1 is epimerized to the corresponding cis isomer using a mild base such as potassium carbonate (path a). The cis geometry is retained in all subsequent steps.

Alternatively, the epimerization step can be omitted to yield trans products (path b).

Aldehyde 2 is reduced using a reducing agent such as sodium borohydride. The alcohol is protected using a typical protecting group such as a t-butyldiphenylsilyl ether, and the boc group is removed under acidic conditions to give 3. The cyclic amine is converted to a sulfonamide by reaction with a sulfonyl halide, and the

alcohol protecting group is removed under standard conditions to give 4. Alcohol 4 can be converted to a variety of compounds of type 1a using methods well-known to those skilled in the art. For example, carbamates can be prepared by reaction of 4 with 4-nitrophenylchloroformate followed by reaction of the resulting carbonate with a primary or secondary amine. Alternatively, esters can be prepared by reaction of 4

- 29 -

with either an acid halide of a carboxylic acid in the presence of a suitable coupling reagent such as EDCI and HOBT.

Starting material of formula 1 in Method 1 are known in the art or can be prepared as described below.

5 **Method 2**

In Method 2, compounds of formula I having the structure Ib are prepared.

10 In Method 2, R¹² is as defined in Method 1

In Method 2, alcohol 4 from method 1 converted to the corresponding primary or secondary amine under a variety of conditions, such as by reaction with phthalimide under Mitsunobu conditions followed by treatment with hydrazine or by reaction with a primary amine under Mitsunobu conditions. The resulting amine is converted to ureas or to amides Ib using the same procedures described for carbamates and esters in Method 1.

Methods 3-A and 3-B

In Methods 3-A and 3-B, compounds of formula I having the structure Ic are prepared.

20 **Method 3-A**

- 30 -

In Method 3-A, 2,6-dibromopyridine is reacted with a boronic acid derivative $R^{11}B(OH)_2$ (most preferably an aryl or vinyl boronic acid) in the presence of a palladium catalyst. The resulting 6-substituted 2-bromopyridine is formylated by treatment with an alkyl lithium such as *n*-butyllithium followed by treatment with a formylating agent such as dimethylformamide to give 7-A. This product is hydrogenated to give alcohol 8 (where any unsaturation in R^{11} may also have been reduced). Alcohol 8 can be converted to compounds of formula 1c using the procedures previously described.

Method 3-B

In Method 3-B, 6-bromopicolinic acid 6-B is converted to its methyl ester under standard conditions followed by reaction with a boronic acid derivative $R^{11}B(OH)_2$ (most preferably an aryl or vinyl boronic acid) in the presence of a palladium catalyst to give 7-B. This is then hydrogenated using a suitable catalyst such as platinum oxide, preferably in the presence of acetic acid, then reduced with a hydride reagent such as lithium aluminum hydride to give alcohol 8. Alcohol 8 can be converted to compounds of formula 1c using the procedures previously described.

Method 4

In Method 4, compounds of formula I having the structure 1d are prepared wherein R^{11} in 9 and 1d represents alkyl having at least two carbons, arylalkyl, or heteroarylalkyl.

- 31 -

In Method 4, R^{20} represents alkyl, unsubstituted aryl, substituted aryl, unsubstituted arylalkyl, substituted arylalkyl, unsubstituted heteroaryl, substituted heteroaryl, unsubstituted heteroarylalkyl, or substituted heteroarylalkyl, wherein these groups are as defined for R^{11} above.

In Method 4, 2,6-dibromopyridine is mono-metallated under a variety of conditions, such as treatment with an alkyllithium at about -78°C or by treatment with a lithium trialkylmagnesiumate complex at -10 to 0°C . The resulting organometallic derivative is reacted with an aldehyde R^{20}CHO , and the product is deoxygenated under a variety of conditions, such as by treatment with triethylsilane, to give **9**. Compound **9** is formylated and the resulting formyl derivative converted compounds of type **Id** using the procedures previously described.

Method 5

In Method 5, compounds of formula I having the structure **Ie** are prepared wherein R^{11} in **10** and **Ie** represents alkyl having at least three carbons, arylalkyl wherein said alkyl moiety has at least two carbons, or heteroarylalkyl wherein said alkyl moiety has at least two carbons.

- 5 In Method 5, 2,6-dibromopyridine is coupled with a mono-substituted alkyne in the presence of a catalyst such as $PdCl_2(PPh_3)_4$ /CuI. The resulting product is formylated, hydrogenated, and converted to compounds **1e** using the procedures previously described.

Method 6

- 10 In Method 6, compounds of formula I having the structure **1e** are prepared wherein R^{11} in **12** and **If** represents alkyl having at least three carbons, arylalkyl wherein said alkyl moiety has at least two carbons, or heteroarylalkyl wherein said alkyl moiety has at least two carbons.

15

In Method 6, R^{21} represents alkyl, unsubstituted aryl, substituted aryl, unsubstituted arylalkyl, substituted arylalkyl, unsubstituted heteroaryl, substituted heteroaryl, unsubstituted heteroarylalkyl, or substituted heteroarylalkyl, wherein these groups are as defined for R^{11} above.

- 20 In Method 6, 2,6-dibromopyridine is mono-metallated as previously described and the resulting organometallic is reacted with a formylating agent such as DMF to give **11**. This compound is reacted with a vinyl tin reagent in the presence of a

- 33 -

catalyst such as $\text{Pd}(\text{PPh}_3)_4$, and the resulting product is hydrogenated to give **12**. Compound **12** is converted to compounds **1f** as previously described.

Method 7

In Method 7, compounds of formula I having the structure **1g** are prepared.

5

10

In Method 7, pyridine-2,6-dicarboxylic acid dimethyl ester is reacted with a reducing agent such as sodium borohydride, and the resulting monohydroxymethyl derivative is treated with an alkylating agent such as an alkyl halide or alkylsulfonate to give **14**. This is hydrogenated over a catalyst such as platinum oxide, and then reacted with a reducing agent such as lithium aluminum hydride to provide an intermediate cyclic amino alcohol. The alcohol function is protected using a typical protecting group such as a t-butyldimethylsilyl ether, the cyclic amine is converted to a sulfonamide by reaction with a sulfonyl halide, and the alcohol protecting group is removed under standard conditions to give **15**. Compound **15** is converted to compounds of type **1g** using the methods previously described.

15

Method 8

In Method 8, compounds of formula I having the structure **1h** are prepared.

20

- 34 -

In Method 8, ketal **16** or alcohol **17** are prepared using the procedures described in Method 1 and Method 2. These are converted to the corresponding ketone by either acid hydrolysis of **16** or by oxidation of **17**. The ketone is converted to compounds of type **1h** by reaction with a primary or secondary amine in the presence of a reducing agent such as sodium borohydride, sodium cyanoborohydride, sodium triacetoxyborohydride, or polymer-bound derivatives thereof.

Method 9

In Method 9, compounds of formula I having the structure **1i** and **1j** are prepared.

- 35 -

In Method 9, intermediate **4** prepared via any of the methods previously described can be oxidized to an aldehyde using a variety of well-known reagents such as Dess-Martin Periodane. The aldehyde is then treated with an alkylmetal reagent such as a Grignard reagent, an alkyllithium reagent, or an alkylzinc reagent to give alcohol **4a**. Intermediate **4a** can be converted to compounds of type **li** using the procedures described in Methods 1 through 8. Alternatively, **4** can be converted to ester **19** and then treated with a Grignard reagent to give **4b**. This is converted to compounds of type **lj** as previously described.

Compounds of type **1k** are prepared according to Method 10.

Method 10:

- 36 -

Ester **20** is protected with a suitable protecting group (Prot) such as t-butyltrimethylsilyl ether, and the pyridine is reduced by well-known methods such as by treatment with hydrogen gas in the presence of a catalyst such as platinum oxide in a solvent such as ethanol or ether, to give piperidine **21**. This is sulfonated by treatment with a sulfonyl halide in the presence of a base such as triethylamine to give **22**. Using well-known methods, the ester of **22** can be converted to **23**, where R^{13} is H or alkyl. For instance, **22** can be reduced to the corresponding aldehyde (**23**, $\text{R}^{13} = \text{H}$) by treatment with DIBAL. The aldehyde can be treated with a Grignard reagent followed by oxidation to give a ketone (**23**, $\text{R}^{13} \neq \text{H}$). Compound **23** can be converted to olefin **24** using well-known methods such as by treatment with an alkyl phosphonium ylide. Olefin **24** can be converted to cyclopropane **25** by well-known methods, for instance, by treatment with a dihalomethane such as diiodomethane in the presence of dialkylzinc and optionally in the presence of trifluoroacetic acid, by treatment with an alkyl or substituted alkyl diazo compound in the presence of a metal such as rhodium chloride, or by treatment of an alkyl halide or substituted alkyl halide with a base such as potassium hydroxide. In the above example, R^{14a} , R^{14b} , and $\text{R}^{14c} = \text{H}$, alkyl, aryl, halo, $-\text{OH}$, $-\text{O}(\text{alkyl})$, $-\text{NH}_2$, $-\text{N}(\text{H})\text{alkyl}$, $\text{N}(\text{alkyl})_2$, or $\text{C}(\text{O})\text{Oalkyl}$. Compound **25** can be converted to compounds of type **1k** using the methods previously described.

Compounds of type **11** are prepared as described in method 11.

Method 11:

- 37 -

Intermediate **19** of method 9 is treated with ethylmagnesium bromide in the presence of Ti(OiPr)_4 to give cyclopropanol **26**, which is converted to compounds of type **11** as previously described.

Method 12:

- 10 Intermediate **22** from method 10 can be hydrolyzed and, optionally as needed, reprotected to give acid **27**. This acid can be transformed to a variety of heteroaryl moieties using methods well-known to those skilled in the art. For instance, coupling with 2-aminoethanol followed by oxidation and dehydrative cyclization according to the method of Morwick *et al* (*Organic Letters* 2002, 2665) gives **28** where R^{11} = 2-oxazolyl. Compounds of type **28** can be transformed into compounds of type **1m**
- 15 using the methods described earlier.

Method 13:

- 38 -

Intermediate **20** from method 10 can be oxidized to aldehyde **29** using, for instance, Dess-Martin periodinane. Aldehyde **29** can be transformed into a variety of intermediates **30** where R¹¹ is heteroaryl using well-known methods. For instance, treatment of **29** with glyoxal and ammonia gives **30** where R¹¹ is 2-imidazolyl. Intermediate **30** can be reduced to piperidine **31** and sulfonylated to give **32** as previously described, and the ester of **32** can be reduced to alcohol **33** using, for instance, lithium aluminum hydride. Intermediate **33** can be transformed to compounds **1n** as previously described.

Chiral compounds of this invention can be resolved by chromatography over a chiral stationary phase as described in the examples.

The invention disclosed herein is exemplified by the following examples which should not be construed as limiting the scope of the invention. Alternative mechanistic pathways and analogous structures within the scope of the invention may be apparent to those skilled in the art.

Example 1

Step 1

Racemic trans 1-(tert-butoxycarbonyl)-2-formyl-6-methyl-piperidine was obtained as described in S. Chackalamannil, R. J. Davies, Y. Wang, T. Asberom, D. Doller, J. Wong, D. Leone and A. T. McPhail, *J. Org. Chem.* **1999**, *64*, 1932-1940. A solution of 5.44 g of this aldehyde was stirred in 100 mL of methanol with 6.0 g of K₂CO₃ overnight. Solids were filtered out, and the residue was concentrated. The mixture was redissolved in DCM, washed with water, dried over Na₂SO₄, concentrated and purified chromatographically using 7% ethyl acetate in hexanes as solvent to furnish 3.2 g of product.

Step 2

a) To a solution of 3.21 g (14.1 mmol) of the product of Step 1 in 20.0 mL of THF at 0 °C was added 534 mg (14.1 mmol) of sodium borohydride. The mixture was stirred for 1.5 h, quenched with saturated NaHCO₃, extracted with ether, dried over Na₂SO₄ and freed from solvent *in vacuo* to give 3.08 g of crude alcohol.

b) The crude alcohol from step 2 was dissolved in 20.0 mL of DMF and treated with 1.83 g (27 mmol) of imidazole and 4.79 g (17.5 mmol) of TBDPSCI. The mixture was stirred overnight, diluted with DCM, washed with water, dried over Na₂SO₄, and solvent was evaporated. The product was purified by chromatography to furnish 4.67 g of TBDPS ether.

- 40 -

c) A solution of 4.67 g of TBDPS ether in 15 mL of DCM was cooled to 0 °C and treated with a mixture containing 30 mL of 99% TFA and 70 mL of DCM. Cooling was removed and the mixture was stirred for 1.5 h. Volatiles were evaporated, the residue was re-evaporated with DCM, re-dissolved in DCM, washed with saturated NaHCO₃, dried over Na₂SO₄, concentrated and passed through a silica gel plug using 5% MeOH in DCM as solvent to yield 3.50 g of product.

Step 3

a) A mixture of 3.50 g (9.53 mmol) of the product of Step 2, 3.02 g of 4-chlorobenzenesulfonyl chloride and 1.92 g (19.06 mmol) of triethylamine in 20.0 mL of DCM was stirred over a period of 48 h. The reaction was washed with saturated NaHCO₃, dried over Na₂SO₄, concentrated and purified by chromatography using 10% ethyl acetate in hexanes as solvent to obtain 4.66 g of sulfonamide.

b) The resulting sulfonamide (4.66 g, 8.61 mmol) was dissolved in 50.0 mL of THF and treated with 17.2 mL (17.2 mmol) of 1M TBAF/THF solution. The mixture was stirred over 1.5 h, poured into water, extracted with ethyl acetate and DCM. The combined organic phases were dried over Na₂SO₄, concentrated and purified by chromatography using gradient of 10-30% ethyl acetate in hexanes as solvent to furnish 2.39 g of product.

Step 4

a) To a mixture of 712 mg (2.3 mmol) of the product of step 3, and 370 mg (4.6 mmol) of pyridine in 10 mL of DCM at 0 °C was added a solution of 4-nitrophenylchlorocarbonate in 5 mL of DCM. The mixture was stirred overnight at ambient temperature, treated with an additional 0.17 mL of pyridine and 100 mg of 4-nitrophenylchlorocarbonate and stirred for additional 5 h. The mixture was diluted with DCM, washed with water, dried over Na₂SO₄, purified by chromatography using 20% ethyl acetate in hexanes as solvent to furnish 860 mg of 4-nitrophenylcarbonate.

b) To a solution of 20 mg of the above product in 0.5 mL of DMF was added 20 mg of 4-(1-piperidino)piperidine. The mixture was allowed to stand overnight, diluted with DCM, washed with 1M NaOH, dried over Na₂SO₄ and purified by prep. TLC (5% MeOH/DCM) to furnish 17 mg of the desired product. ¹H NMR (CDCl₃, 300 MHz) δ 7.75 (2H, d, J=8.5 Hz), 7.45 (2H, d, J=8.5 Hz), 4.33-4.20 (4H, m), 4.11-4.00 (2H, m), 2.74 (2H, wide), 2.48-2.34 (5H, ser.m.), 1.80-1.22 (16H, ser.m.), 1.30 (3H, d, J=7.1 Hz); MS (ES) *m/e* 498.1 (M+H)⁺.

Preparation A: cis (6-Phenyl-piperidin-2-yl)-methanol:**Step 1**

(a) To a mixture of 600 mg (2.5 mmol) of 2,6-dibromopyridine in 15 mL of toluene was added a mixture of 150 mg (1.27 mmol) of phenylboronic acid in 5 mL of methanol, 86 mg (0.075 mmol) of Pd(PPh₃)₄ and 15 mL of 2 M Na₂CO₃. The mixture was refluxed overnight, cooled, extracted with ethyl acetate, dried and 2-bromo-6-phenylpyridine isolated chromatographically from unreacted 2,6-dibromopyridine and 2,6-diphenylpyridine.

(b) To a solution of 7.2 g (31.03 mmol) of 2-bromo-6-phenylpyridine in 50 mL of THF at -78 °C was added drop-wise 13.5 mL (31 mmol) of 2.3 M n-BuLi in hexanes followed by 10 mL of DMF. The mixture was stirred in the cold for 30 min, quenched with saturated NaHCO₃, extracted with ethyl acetate, dried, concentrated, and purified by chromatography using a gradient of 3-5% of ethyl acetate in hexanes to provide 2.02 g of product

Step 2

To a solution of 2 g of the product of step 1 in 20 mL of MeOH was added 5 mL of AcOH and 300 mg of PtO₂. The mixture was hydrogenated under a balloon. The progress of the reaction was followed by taking NMR spectra of worked-up portions. After overnight stirring another portion of 300 mg of PtO₂ was added and hydrogenation continued for additional 24 h. Catalyst was filtered out, volatiles evaporated, residue re-dissolved in DCM and washed with 1M NaOH solution, saturated NaHCO₃, dried, and evaporated. Column chromatography yielded 1.30 g of cis (6-phenyl-piperidin-2-yl)-methanol and 200 mg of cis (6-cyclohexyl-piperidin-2-yl)-methanol.

Preparation B: Alternate synthesis of cis (6-phenyl-piperidin-2-yl)-methanol:**Step 1**

Treat 6-bromopicolinic acid (1.99 g) in DMF (10 mL) with potassium carbonate (1.40 g) and then methyl iodide (4 mL) at room temperature for 20 h. Dilute the reaction mixture with dichloromethane (60 mL) and filter. Extract the filtrate with brine (twice), dry (MgSO₄), and concentrate in vacuo to give methyl 6-Bromopicolinate as a pale yellow solid (1.75 g).

Step 2

- 54 -

Heat methyl 6-bromopicolinate (0.75 g), phenylboronic acid (0.61 g), tetrakis(triphenylphosphine)palladium (0.19 g) and potassium carbonate (0.75 g) in toluene (20 mL) and methanol (4.5 mL) under reflux for 1 hr. Cool the reaction mixture, dilute with dichloromethane, and filter. Wash the filtrate with water.

- 5 Concentrate the dried (K_2CO_3) organic solution *in vacuo* to give an amber residue (0.81 g). Chromatograph this residue on silica gel plates (8, 1000 μ) using hexane:ethyl acetate 3:1 as eluant to give methyl 6-phenylpicolinate as a colorless oil (0.55 g).

Step 3

- 10 Under a hydrogen atmosphere, stir methyl 6-phenylpicolinate (0.55 g) in MeOH (30 mL) and glacial acetic acid (15 mL) in the presence of platinum oxide (0.150 g) for 5 hr. Purge the reaction mixture with nitrogen. Filter and then concentrate the reaction mixture *in vacuo* to give a yellow oil (0.77 g). Chromatograph this oil on silica gel plates (8, 1000 μ) using hexane:ethyl acetate 3:1 eluant to give methyl 6-phenylpipercolinate as a colorless oil (0.23 g).
- 15

Step 4

- Treat methyl 6-phenylpipercolinate (0.23 g) in THF (15 mL) with 1M lithium aluminum hydride in ether (10 mL) at room temperature for 2 h. Quench the reaction mixture with EtOAc, then add $MgSO_4$ and filter. Concentrate the filtrate to give a residue. Chromatograph the residue on silica gel plates (2, 1000m) using EtOAc:hexane 1:1 as eluant to give (6-phenyl-piperidin-2-yl)-methanol as a white solid (0.06 g).
- 20

Preparation C:

Step 1

- 25 (a) At 0 °C, to a solution of 1.29 g (6.77 mmol) of cis (6-phenyl-piperidin-2-yl)-methanol from Preparation A or Preparation B in 20.0 mL of DCM was added 1.90 mL (13.6 mmol) of triethylamine and 1.84 mL (10.1 mmol) of trimethylsilyl trifluoromethanesulfonate. The mixture was stirred for 1 h at ambient temperature, washed with saturated $NaHCO_3$, dried over Na_2SO_4 and volatiles were evaporated.
- 30 (b) The residue was re-dissolved in DCM, treated with 1.90 mL (13.5 mmol) of triethylamine and 2.11 g (10.0 mmol) of 4-chlorobenzenesulfonylchloride. The mixture was stirred for 24 h, washed with 1M HCl, saturated $NaHCO_3$, and concentrated.
- (c) To insure cleavage of TMS ether, the material was dissolved in methanol (5 mL), treated with 1 mL of 1M HCl, stirred for 30 min, and concentrated. The residue

- 55 -

was chromatographed using 10-20% ethyl acetate in hexanes to furnish 1.45 g of 1-(4-Chloro-benzenesulfonyl)-6-phenyl-piperidin-2-yl]-methanol.

Step 2

10 Following procedures similar to those in Example 53, the compounds in Table 4 were prepared. Cis-(6-cyclohexyl-piperidin-2-yl)-methanol, obtained in Preparation A, step 2, was used in Examples 63-66.

**Step 1**

(a) A solution of 1.00 g (4.29 mmol) of 2,6-dibromopyridine in a mixture of 20 mL of ether and 20 mL of THF was cooled to -78°C (becomes turbid due to partial precipitation). To this was added drop-wise 1.86 mL (4.29 mmol) of 2.3 M BuLi, and the reaction was stirred for 5 min.

(b) Benzaldehyde (456 mg, 4.3 mmol) was added drop-wise to the above mixture, and the reaction was stirred in the cold for 15 min, quenched with saturated NaHCO_3 , extracted with ethyl acetate, dried, concentrated. The residue was purified by chromatography using a gradient of 10-30% of ethyl acetate in hexane as solvent to give 0.85 g of oily product.

- 76 -

(c) A mixture of the above product, 5 ml of triethylsilane, 5 mL of TFA and 5 mL of DCM was heated at reflux over a period of 36 h. After evaporating most of the volatiles, the residue was redissolved in DCM, washed with 1M NaOH, dried, concentrated, and purified by chromatography using 5% ethyl acetate in hexanes.

Extract the organic mixture with brine. Concentrate the dried (MgSO₄) solution *in vacuo* to a residue (0.070 g). Chromatograph this

- 92 -

residue on silica gel plates (1, 1000 μ) using EtOAc:hexane 1:3 as eluant to give the title compound (0.040 g).

Preparation C

Add amines (1.2 equiv) followed by MP-cyanoborohydride resin (~2 equiv, 20 to 30 mg., 2.37 mmol/g, Argonaut). Shake the resulting mixture at room temperature for 20 hr. Add PS-isocyanate resin (50 – 60 mg, 4 equiv. 1.44 mmol/1 g, Argonaut). After 4h, add additional PS-isocyanate resin (90-100 mg) and leave shaking overnight. Filter from Bohdan block to block and wash the residue with MeOH (1 mL). Add MP-TsOH resin (~4 equiv., 1.46 mmol/mg, Argonaut) to filtrate followed by dichloroethane (1 mL). Shake for 2-4 hr. Drain and wash with MeOH (1 mL, 3 times). Add 2M NH₃/MeOH (1.5 mL), shake for 30 min. Drain into vials. Add 2M NH₃/MeOH (2 mL) and shake for 10 min. and drain. Remove the solvent in to give the products in Table 11.

Gamma secretase activity was determined as described by Zhang *et al.* (*Biochemistry*, **40** (16), 5049 -5055, 2001). Activity is expressed either as a percent inhibition or as the concentration of compound producing 50% inhibition of enzyme activity.

Reagents. Antibodies W02, G2-10, and G2-11 were obtained from Dr. Konrad Beyreuther (University of Heidelberg, Heidelberg, Germany). W02 recognizes residues 5-8 of A β peptide, while G2-10 and G2-11 recognize the specific C-terminal structure of A β 40 and A β 42, respectively. Biotin-4G8 was purchased from Senetec (St. Louis, MO). All tissue culture reagents used in this work were from Life Technologies, Inc., unless otherwise specified. Pepstatin A was purchased from Roche Molecular Biochemicals; DFK167 was from Enzyme Systems Products (Livermore, CA).

cDNA Constructs, Tissue Culture, and Cell Line Construction. Biol. Chem.* 274, 8966-8972). Upon insertion into the membrane, the 17 amino acid signal peptide is processed, leaving an additional leucine at the N-terminus of A β . SPC99-Lon was cloned into the pcDNA4/TO vector (Invitrogen) and transfected into 293 cells stably transfected with pcDNA6/TR, which is provided in the T-REx system (Invitrogen). The transfected cells were selected in Dulbecco's modified Eagle's media (DMEM) supplemented with 10% fetal bovine serum, 100 units/mL penicillin, 100 g/mL streptomycin, 250 g/mL zeocin, and 5 g/mL blasticidin (Invitrogen). Colonies were screened for A β production by inducing C99 expression with 0.1 g/mL tetracycline for 16-20 h and analyzing conditioned media with a sandwich immunoassay (see below). One of the clones, designated as pTRE.15, was used in these studies.

Membrane Preparation. C99 expression in cells was induced with 0.1 g/mL tetracycline for 20 h. The cells were pretreated with 1 M phorbol 12-myristate 13-acetate (PMA) and 1 M brefeldin A (BFA) for 5-6 h at 37 C before harvesting. The cells were washed 3 times with cold phosphate-buffered saline (PBS) and harvested in buffer A containing 20 mM Hepes (pH 7.5), 250 mM sucrose, 50 mM KCl, 2 mM EDTA, 2 mM EGTA, and Complete protease inhibitor tablets (Roche Molecular

Biochemicals). The cell pellets were flash-frozen in liquid nitrogen and stored at -70 C before use.

To make membranes, the cells were resuspended in buffer A and lysed in a nitrogen bomb at 600 psi. The cell lysate was centrifuged at 1500g for 10 min to remove nuclei and large cell debris. The supernatant was centrifuged at 100000g for 1 h. The membrane pellet was resuspended in buffer A plus 0.5 M NaCl, and the membranes were collected by centrifugation at 200000g for 1 h. The salt-washed membrane pellet was washed again in buffer A and centrifuged at 100000g for 1 h. The final membrane pellet was resuspended in a small volume of buffer A using a Teflon-glass homogenizer. The protein concentration was determined, and membrane aliquots were flash-frozen in liquid nitrogen and stored at -70 C.

γ -Secretase Reaction and A β Analysis. To measure γ -secretase activity, membranes were incubated at 37 C for 1 h in 50 L of buffer containing 20 mM Hepes (pH 7.0) and 2 mM EDTA. At the end of the incubation, A β 40 and A β 42 were measured using an electrochemiluminescence (ECL)-based immunoassay. A β 40 was identified with antibody pairs TAG-G2-10 and biotin-W02, while A β 42 was identified with TAG-G2-11 and biotin-4G8. The ECL signal was measured using an ECL-M8 instrument (IGEN International, Inc.) according to the manufacturer's instructions. The data presented were the means of the duplicate or triplicate measurements in each experiment. The characteristics of γ -secretase activity described were confirmed using more than five independent membrane preparations.

Pharmaceutical compositions can comprise one or more of the compounds of formula I. For preparing pharmaceutical compositions from the compounds described by this invention, inert, pharmaceutically acceptable carriers can be either solid or liquid. Solid form preparations include powders, tablets, dispersible granules, capsules, cachets and suppositories. The powders and tablets may be comprised of from about 5 to about 95 percent active compound. Suitable solid carriers are known in the art, e.g. magnesium carbonate, magnesium stearate, talc, sugar or lactose. Tablets, powders, cachets and capsules can be used as solid dosage forms suitable for oral administration. Examples of pharmaceutically acceptable carriers and methods of manufacture for various compositions may be found in A. Gennaro (ed.), Remington's Pharmaceutical Sciences, 18th Edition, (1990), Mack Publishing Co., Easton, Pennsylvania.

Liquid form preparations include solutions, suspensions and emulsions. As an example may be mentioned water or water-propylene glycol solutions for parenteral injection or addition of sweeteners and opacifiers for oral solutions, suspensions and emulsions. Liquid form preparations may also include solutions for intranasal administration.

Aerosol preparations suitable for inhalation may include solutions and solids in powder form, which may be in combination with a pharmaceutically acceptable carrier, such as an inert compressed gas, e.g. nitrogen.

- 153 -

Also included are solid form preparations which are intended to be converted, shortly before use, to liquid form preparations for either oral or parenteral administration. Such liquid forms include solutions, suspensions and emulsions.

5 The compounds of the invention may also be deliverable transdermally. The transdermal compositions can take the form of creams, lotions, aerosols and/or emulsions and can be included in a transdermal patch of the matrix or reservoir type as are conventional in the art for this purpose.

10 Preferably, the pharmaceutical preparation is in a unit dosage form. In such form, the preparation is subdivided into suitably sized unit doses containing appropriate quantities of the active compound, e.g., an effective amount to achieve the desired purpose.

15 The quantity of active compound in a unit dose of preparation may be varied or adjusted from about 0.01 mg to about 1000 mg, preferably from about 0.01 mg to about 750 mg, more preferably from about 0.01 mg to about 500mg, and most preferably from about 0.01 mg to about 250 mg, according to the particular application.

20 The actual dosage employed may be varied depending upon the requirements of the patient and the severity of the condition being treated. Determination of the proper dosage regimen for a particular situation is within the skill of the art. For convenience, the total daily dosage may be divided and administered in portions during the day as required.

25 The amount and frequency of administration of the compounds of the invention and/or the pharmaceutically acceptable salts thereof will be regulated according to the judgment of the attending clinician considering such factors as age, condition and size of the patient as well as severity of the symptoms being treated. A typical recommended daily dosage regimen for oral administration can range from about 0.04 mg/day to about 4000 mg/day, in one to four divided doses.

30 While the present invention has been described in conjunction with the specific embodiments set forth above, many alternatives, modifications and variations thereof will be apparent to those of ordinary skill in the art. All such alternatives, modifications and variations are intended to fall within the spirit and scope of the present invention.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/US 03/03471

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:

Although claims 15-19 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this International application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
